

Tasseled Cap delta vectors from 2018 to 2020 in TC brightness-greenness space, shown as a two-by-five grid of small multiples with one panel per class over a grey 2018 reference cloud. Each faint headless segment is one point's displacement, so the fan width shows within-class spread, and the single bold arrow gives the class-mean displacement, so its direction and length show the coherent change. Read the bold arrows to compare how strongly and which way each class moved.
